

WATER TREATMENT SYSTEMS

PES is pleased to present our Water Softening System. PES can provide all the necessary tools to test your water and then can recommend the most beneficial line of action. Treating water prior to the high pressure pump of your water cutter will greatly enhance its performance, and will lead to increased lifespan on all high pressure parts, including orifices.

As the largest percentage of a typical marinade, it is critical to have high quality water, but it is often overlooked. Water serves as the carrier for all other ingredients, such as phosphates and salts. If you are using hard water you could be losing out on significant marination retention. When the metals in hard water tie up phosphates, they are no longer able to bind to the product, and you end up with low marination pick-ups. Therefore, failure to ensure proper water quality can potentially

result in poor product yields and gross monetary losses for meat and poultry processors. A low cost and easy to maintain water softening system is the solution you've been

Benefits of Soft Water

- Superior High Pressure Water Cutting
- Less Wear on High Pressure Parts
- Higher Marination Yields
